

Oracle EPM Predictive Cash Forecasting

Transaction Drill-Through - Advanced Lab Guide

**Product Design Documentation • Implementation Guide • Training Material • Technical Reference •
Troubleshooting Handbook**

Advanced-stage focus

This guide shows how to design, configure, validate and use transaction drill-through in Oracle EPM Predictive Cash Forecasting so advanced users can move from forecast cells to ERP analytical summaries and detailed source transactions for Receivables, Payables and Cash Management.

Lab Property	Design
Scope	Transaction drill-through for seeded Fusion AR, AP, and Cash Management sources
User objective	Move from PCF forecast/actual cells to explainable ERP detail
Technical objective	Enable secure, performant, traceable drill paths
Operational objective	Improve variance analysis, corrective action and user confidence
Audience	Advanced Oracle EPM consultants, treasury users, solution architects, administrators

BISP Trainings

1. Purpose and Learning Outcomes

Why drill-through matters

Forecasts are only trusted when finance users can explain them. Drill-through closes the gap between a cash-forecast number and the underlying business events that created it, making variance analysis faster and decisions more defensible.

- Explain the seeded Oracle drill-through path from PCF to Fusion ERP Analytical Views and detailed transactions.
- Design security so users can drill with a single sign-on and only see data they are authorized to access.
- Validate source mappings and data lineage so every drilled amount has traceable context.
- Use drill-through in AR, AP and Cash Management scenarios to diagnose variances and plan actions.
- Troubleshoot common failures such as missing access, disabled Analytical Views, and mapping mismatches.
- Operationalize drill-through as part of production forecasting, reconciliation and approval workflows.

Business Outcomes

Outcome	Benefit
Higher forecast trust	Users can inspect the transactions behind a forecast or actual balance.
Faster variance analysis	Teams move directly from an outlier to the likely business driver.
Better corrective actions	Collections, payment timing or liquidity actions can be targeted with evidence.
Improved governance	Forecast overrides can cite exact source transactions and audit evidence.

2. Oracle Capability Context

Current Oracle capability	Implication for design
Ready-to-use Fusion ERP integration for AR, AP and Cash Management	Transaction drill-through is grounded in seeded source objects and pipelines.
Pre-seeded Data Integration pipelines	Source data can be loaded with repeatable orchestration and controls.
Drill to aggregate Analytical Views and then detailed transactions	User experience should support two drill layers: summary then detail.
SSO plus matched ERP/EPM security required	User provisioning is part of solution design, not an afterthought.
PCF applications are multi-currency and Hybrid Essbase enabled	Cross-currency and reporting-performance considerations matter.

Grounding note

Oracle documents that PCF integration with Oracle Cloud ERP is generally available and that users can drill through to Cloud ERP aggregate Analytical Views and detailed transactions for Receivables, Payables and Cash Management.

3. Reference Architecture

Transaction Drill-Through Reference Architecture

Drill-through path: forecast or actual in PCF → analytical summary in ERP → detailed source transactions.

The architecture combines seeded Fusion ERP source data, Data Integration pipelines, PCF forecast artifacts and ERP analytical drill targets. The design objective is simple: a user reviewing a forecast cell in EPM should be able to understand how that number was formed and what transactions explain it.

Source Coverage

Source area	Typical drilled objects	Typical use case
Receivables	Invoices, installment due dates, receipts, overdue items	Investigate shortfall in expected collections
Payables	Supplier invoices, holds, terms, payments	Explain spikes or deferrals in cash outflows
Cash Management	Bank accounts, balances, statement lines	Reconcile opening/closing cash and liquidity headroom

4. Drill-Through User Journey

Drill-Through User Journey

1. The analyst reviews a PCF dashboard, form or variance report and identifies a cell that requires explanation.
2. The analyst selects the specific measure and context: entity, period, version and scenario.
3. The drill menu opens the connected Oracle Fusion ERP analytical layer.
4. The Analytical View provides an aggregated business context such as customer, supplier, party, bank account or business unit.
5. The analyst narrows the issue using available business attributes.
6. The analyst drills again to detailed transactions such as invoices, payments or bank lines.
7. The user documents the root cause and proposes an operational or forecasting action.
8. If needed, the user adjusts the forecast through a governed override or management-action scenario.

Design goal

Drill-through should lead to action, not just visibility. The process should naturally end with diagnosis, commentary and, when appropriate, a controlled update to the forecast.

5. Data Lineage and Mapping

Data Lineage and Drill Context

Critical Mapping Elements

Element	Purpose	Control expectation
Entity / Business Unit mapping	Align ERP organizational units to PCF entities	No unmapped entities in production
Cash-flow line item mapping	Classify source transactions to forecast line items	Document mapping ownership and changes
Currency alignment	Support local and reporting currency analysis	Validate source and target currency setup
Custom business attributes	Enable richer Analytical View slicing	Only keep attributes that aid decision-making
Transaction identifiers	Preserve explainability and duplicate prevention	Retain invoice/payment keys across the flow

Lineage rule

A drill must land in source data that the user recognizes. If the drill amount cannot be reconciled to loaded totals and business attributes, forecast confidence erodes immediately.

6. Security, Access and SSO

Security layer	Requirement
Single sign-on	Users should access Cloud EPM and Cloud ERP with one credential set.
ERP role design	Define job roles and data access in Oracle Cloud ERP appropriate to drill targets.
EPM security	Entity-level and application security must reflect business responsibilities.
Matched scope	ERP access and EPM access must align so drill-through exposes only authorized data.
Segregation of duties	Power to view transactions does not automatically imply power to override forecasts.

- Create at least one controlled test user per business role to validate drill access before go-live.
- Where legal-entity scope differs by role, validate each entity explicitly; a single successful drill is not enough.
- Include security validation in regression tests whenever roles, entities or integrations change.

7. Oracle-Inspired Configuration Mockup

Oracle-Inspired Configuration Mockup

Home > Application > Configure > Enable Features > Fusion ERP Integration / Drill-Through

Connection
Fusion ERP PROD

Seeded Source
AR / AP / Cash Mgmt

Analytical Views
Enabled

SSO
Active

Data Access Match
Entity level aligned

Drill Target
Summary → Detail

Validation
Open in test user session

Save & Validate

Configuration Sequence

1. Create or validate the PCF application and enable appropriate features.
2. Configure the Cloud EPM connection to Oracle Cloud ERP.
3. Request or validate Analytical Views enablement in the ERP environment.
4. Enable the relevant ERP feature opt-in and complete ERP-side configuration.
5. Configure the seeded source integrations and test pipelines.
6. Confirm SSO and aligned user security in ERP and EPM.
7. Validate drill behavior from forecast, actual and variance views using controlled test data.

8. Dashboard and UX Design

Drill-Through Dashboard Mockup

Recommended UX Principles

- Make drillable cells visually obvious but not noisy.
- Show the selected context clearly: entity, period, version, scenario and line item.
- Surface the most useful business attributes in the Analytical View first.
- Capture user actions or notes after a drill to encourage accountable decision-making.
- Track usage metrics such as drill count, response time and top error categories.

9. Advanced Lab Scenario

Scenario

Entity US01 has a weekly closing cash shortfall relative to the Base forecast. The treasury analyst must determine whether the issue comes from delayed customer receipts, accelerated supplier payments, or a bank-balance timing issue.

Context	Value
As-of date	31-Aug-2026
Forecast horizon	13-week rolling forecast
Minimum cash buffer	\$3.0M
Selected exception	W3 closing cash is \$1.2M below Base forecast
Available seeded sources	Receivables, Payables, Cash Management

Advanced Lab Flow

10. Lab Step 1 - Identify the Variance

Metric	Base Forecast (\$M)	Actual / Latest (\$M)	Variance (\$M)	Initial hypothesis
Receivables Inflow W3	4.8	3.9	-0.9	Collections delay
Payables Outflow W3	2.7	3.0	+0.3	Early/urgent supplier payment
Opening Cash W3	7.8	7.8	0.0	No issue
Closing Cash W3	6.2	5.0	-1.2	Requires drill-through

What to drill first

Start with the largest explanatory variance. Here the shortfall appears primarily driven by lower collections, so the first drill target is Receivables.

11. Lab Step 2 - Drill to Receivables Analytical View

Customer / Segment	Forecasted Collection (\$000)	Latest Expected / Actual (\$000)	Variance	Likely reason
Northstar Retail	1,250	650	-600	Disputed invoices / delayed receipt
Axis Distribution	900	880	-20	Normal timing noise
Metro Health	760	520	-240	Installment pushed to W4
Other customers	1,890	1,850	-40	Within tolerance

From the Analytical View, the user sees that Northstar Retail drives the largest variance. The next action is to open detailed transactions to confirm whether overdue items, disputes or receipts in transit explain the gap.

12. Lab Step 3 - Drill to Detailed Receivables Transactions

Invoice	Customer	Amount (\$000)	Due Date	Status	Comment
AR-9031	Northstar Retail	320	W2	Overdue	Customer dispute open
AR-9068	Northstar Retail	180	W3	Pending receipt	Bank receipt expected next week
AR-9099	Northstar Retail	100	W3	Not approved	Billing issue
AR-8771	Metro Health	240	W3	Rescheduled	Receipt shifted to W4

Root-cause insight

The main collections shortfall is not random noise; it is explained by a customer dispute, a receipt expected next week and a billing approval issue. This evidence supports a management action rather than a blind forecast overwrite.

13. Lab Step 4 - Drill to Payables and Cash Management

Source	Observation	Cash impact	Action implication
Payables drill	Supplier Omega received a \$0.3M early payment due to service-critical status	Unfavorable W3 cash variance	No reversal; classify as management action
Cash Management drill	Bank balance timing is accurate; no reconciliation issue found	No impact	Eliminates bank-data hypothesis
Combined conclusion	Receivables delay + urgent supplier payment explain the full variance	-1.2M	Update commentary and scenario

14. Lab Step 5 - Update the Forecast and Commentary

Scenario	W3 Closing Cash (\$M)	Interpretation
Base (before drill)	6.2	Original expectation
Observed latest	5.0	Shortfall requiring explanation
Management Action	5.5	Assumes Northstar dispute partially resolved and noncritical W4 payment deferral
Stress	4.6	Assumes full collection delay persists

- Record commentary citing the specific invoices and payment that explain the shortfall.
- Update the Management Action scenario rather than overwriting the Base scenario without evidence.
- Attach approver notes if any override changes a published forecast number.

15. Use Cases by Functional Area

Area	Typical drill question	Expected drilled detail
Receivables	Why is expected cash lower than forecast?	Customer invoices, overdue items, receipts, installment dates
Payables	Why did this week outflow spike?	Supplier invoices, holds, payment terms, executed payments
Cash Management	Why does opening or closing cash not reconcile?	Bank account balances, statement lines, available/booked amounts

Best practice

Use drill-through as part of the weekly treasury cadence, not only as an exception tool. Frequent use reinforces data quality, speeds action and improves user confidence.

16. Reconciliation and Control Framework

Control	Description	Frequency
Source-to-load totals	Compare ERP control totals to accepted target amounts	Every pipeline run
Drill landing test	Open representative drill paths by source and entity	Every release / security change
User access certification	Validate matched ERP/EPM access by role	Quarterly
Variance evidence review	Check that material overrides cite drilled evidence	Every approval cycle
Pipeline completeness	Confirm no rejected or unmapped records distort drill context	Every pipeline run

17. Monitoring Dashboard Metrics

Metric	Why it matters
Drill-through success rate	Shows reliability of configuration and user access
Average response time	Indicates user experience and possible ERP/performance issues
Most-drilled line items	Reveals where users need most explanation or where process volatility exists
Top error codes	Focuses support effort on access, mapping or environment issues
Drill-backed overrides	Measures whether decisions are evidence-based

18. Security and Governance Workflow

Role	Responsibility
Service Administrator	Connections, feature enablement, pipelines, technical support
ERP Security Admin	Roles, data access, Analytical View readiness, SSO alignment
Cash Manager / Treasury Analyst	Use drill-through for variance analysis and commentary
Controller / Reviewer	Approve management actions and evidence-backed overrides
Audit / Risk	Review access design, override evidence and support controls

Governance principle

Transaction visibility should support decision-making, but it must never bypass formal approval for changing published forecasts or taking material treasury actions.

19. Logs and Error Examples

Log / Error Examples

ERROR DRL-101 Analytical Views not enabled for ERP environment. Drill-through unavailable.

ERROR DRL-204 User lacks ERP data access for Entity US01. Security mismatch detected.

WARN DRL-118 Drill opened Analytical View but no detailed transactions matched selected period.

INFO DRL-001 Drill-through launched from Receivables Overdue Invoice Summary to 248 transactions.

Troubleshooting Matrix

Symptom	Likely cause	Resolution
Drill option missing	Feature not enabled or source not eligible	Validate configuration and source type
Drill opens but no data shown	Incorrect context, empty source range or mapping issue	Check period, entity, source load and mappings
Access denied in ERP	Security mismatch or missing ERP data access	Align roles and entity-level access
Analytical View unavailable	ERP Analytical Views not enabled	Complete enablement steps and retest
Slow performance	Large result set or environment latency	Filter context, monitor performance, review scope
User sees wrong entity data	Broken security alignment	Correct ERP/EPM security immediately

20. Drill-Through Troubleshooting Decision Tree

Drill-Through Troubleshooting Decision Tree

The decision tree helps support teams isolate whether the issue is source eligibility, Analytical View readiness, security alignment or a downstream data-quality problem.

21. Production Runbook

1. Run or monitor seeded PCF pipelines for AR, AP and Cash Management.
2. Verify source-to-load control totals and review rejected records.
3. Validate at least one representative drill path per source area in the production support window.
4. Open dashboards and review major forecast variances.
5. Use drill-through for top material variances before forecast sign-off.
6. Document commentary, management actions and overrides with source evidence.
7. Publish approved version and archive run IDs, logs and exception reports.

Operational note

A production drill-through capability is not complete until monitoring, support ownership and evidence archiving are clearly defined.

22. Implementation Checklist

- ☐ Confirm the target PCF application is configured and ready for Fusion ERP integration.
- ☐ Request and validate Analytical Views in the ERP environment.
- ☐ Enable the required Fusion ERP feature opt-ins and setup tasks.
- ☐ Configure Cloud EPM → Cloud ERP connection and SSO.
- ☐ Configure seeded Data Integration pipelines for AR, AP and Cash Management.
- ☐ Validate organization, currency and line-item mappings.
- ☐ Provision matched ERP and EPM user security.
- ☐ Test drill-through with representative users by entity and source area.
- ☐ Build monitoring for pipeline status, drill success rate and error categories.
- ☐ Train users on moving from drill results to commentary and action.
- ☐ Finalize support model, escalation path and runbook.
- ☐ Complete UAT and sign-off.

23. Advanced Student Challenge

Challenge

Design a drill-through investigation for a case where weekly closing cash is \$2.4M below forecast, but the variance is split across three entities and two currencies. One entity has a security mismatch that blocks AP drill-through.

- Outline the investigation order and explain why.
- Show how to isolate AR, AP and Cash Management contributions to the shortfall.
- Describe how you would restore secure drill access without over-provisioning the affected user.
- Propose a governance-compliant forecast response using Base, Stress and Management Action versions.

24. Summary and Completion Criteria

- Users can drill from PCF forecast/actual results to ERP Analytical Views and detailed transactions.
- Security is aligned so each role sees only authorized data.
- Source-to-load reconciliation and lineage support trust in drilled values.
- Drill-through is integrated into variance analysis and approval workflows.
- Support teams can diagnose and recover from common drill-through issues quickly.
- The organization can convert visibility into better liquidity and working-capital decisions.

End state

A well-designed transaction drill-through solution transforms Predictive Cash Forecasting from a forecast display into a decision system backed by real business evidence.
