

ORACLE EPM PREDICTIVE CASH FORECASTING

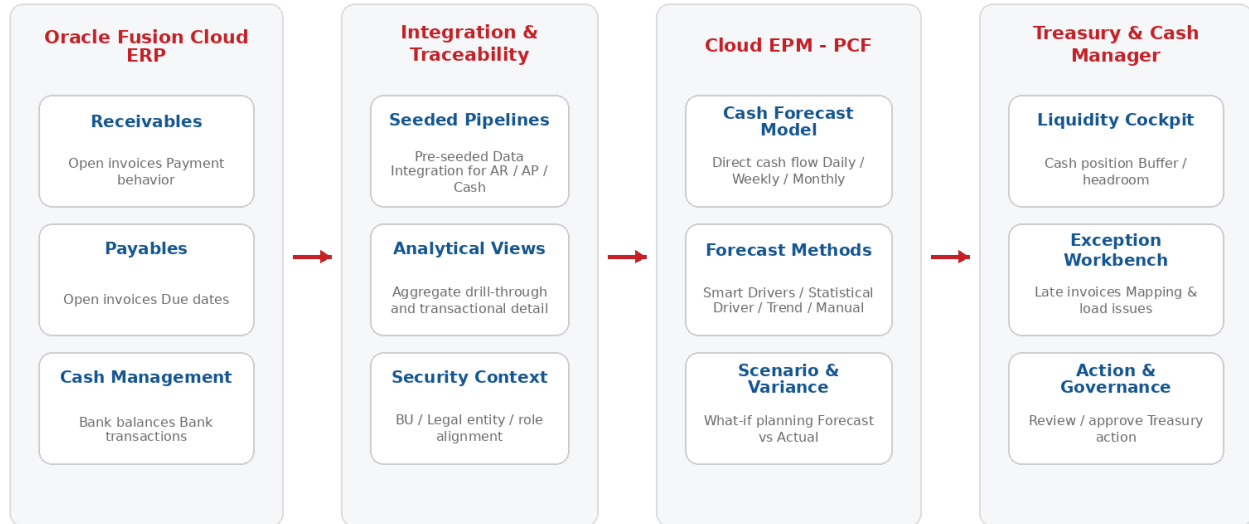

Fusion ERP Integration

Advanced Lab Guide | Product Design + Implementation + Training + Technical Reference + Troubleshooting

Advanced-stage outcome

Design, configure, operate and troubleshoot the Oracle Fusion Cloud ERP to Oracle EPM Predictive Cash Forecasting integration, with end-to-end traceability from treasury forecast values back to source analytical views and ERP transactions.

Fusion ERP Integration Architecture

1. Guide Purpose, Audience and Lab Outcomes

This guide is designed for advanced Oracle EPM consultants, Fusion Financials integration specialists, treasury solution architects, administrators, and support teams. It treats the integration as an operational product: source readiness, extraction, mapping, forecasting, traceability, controls and failure recovery are all part of one design.

By the end of the lab, students will be able to

- Explain the seeded Fusion ERP integration scope for Accounts Receivable, Accounts Payable and Cash Management.
- Enable PCF features correctly so Fusion ERP integration dimensions are created at initial enablement.
- Design source-to-target mappings for Business Unit, Party, Entity, Bank/Bank Account, Currency and Cash Flow Line Item.
- Run and validate pre-seeded Data Integration pipelines and reconcile record counts and amounts.
- Trace a forecast/actual amount to ERP aggregate Analytical Views and detailed transactions.
- Diagnose connection, mapping, security, freshness, drill-through and forecast-method issues.
- Operate a governed daily/weekly/monthly refresh with approvals, exceptions and audit evidence.

Document modes

Use	What this guide provides
Product design documentation	Reference architecture, UI concepts, dimensions, controls and user journeys.
Implementation guide	Enablement, connections, mappings, pipelines, security, validation and go-live steps.
Training material	Hands-on lab with numeric data, expected results and validation checkpoints.
Technical reference	Source objects, target dimensions, job sequencing, drill-through and operational metadata.
Troubleshooting handbook	Decision tree, log examples, symptom/root-cause/remediation tables.

2. Current Oracle Capability Baseline

Current release context

Oracle announced Predictive Cash Forecasting integration with Oracle Cloud ERP as generally available in the April 2026 Cloud EPM update. The integration provides automated ready-to-use sources for Receivables, Payables and Cash Management, pre-seeded Data Integration pipelines, and drill-through to Cloud ERP aggregate Analytical Views and detailed transactions.

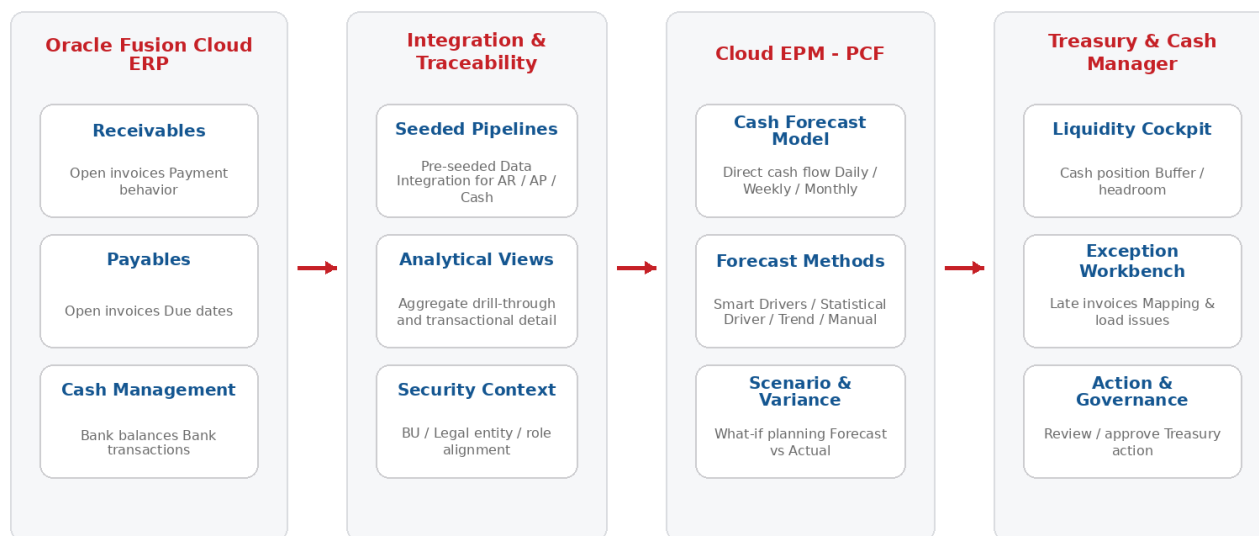

Capability	Implementation meaning
Fusion ERP source scope	Seed Receivables, Payables and Cash Management cash flows.
Pre-seeded pipelines	Start with Oracle-delivered Data Integration patterns; extend only where business requirements justify it.
Transaction traceability	Users can analyze a PCF amount, drill to an aggregate analytical view, then inspect underlying ERP transactions.
Continuous forecasting	ERP transactions support daily, weekly or monthly rolling cash forecasts.
PCF application model	Planning application type using direct cash flow methodology and multi-currency Hybrid Essbase.
Experience	Role-based Redwood experience for administrators, cash managers and other users.

Important prerequisites and constraints

- EPM Enterprise subscription and a separate PCF-enabled Cloud EPM instance are required.
- Analytical Views are required for the Fusion ERP integration and drill-through experience.
- Users involved in cross-application analysis need appropriate access in both Cloud ERP and Cloud EPM.
- Operational ERP business processes that affect cash must be current and complete; integration cannot compensate for stale transactional operations.
- When Fusion ERP Data Sources are needed, enable them during the first feature enablement. Business Unit and Party dimensions become mandatory and cannot simply be added later through incremental enablement.
- PCF applications are multi-currency and Hybrid Essbase enabled.

3. Reference Architecture

Fusion ERP Integration Architecture

Design principles

Principle	Design rule
Source fidelity	Do not transform away transaction attributes needed for reconciliation or action.
Traceability	Preserve a path from PCF line item -> source integration -> analytical view -> transaction detail.
Security parity	Entity and business access must be consistent across EPM and ERP for drill-through.
Separation of concerns	ERP owns operational transactions; EPM owns forecast logic, scenarios, adjustments and cash planning.
Recoverability	Every pipeline step must be restartable without creating duplicate balances.
Observability	Persist job status, counts, rejects, mapping failures and freshness timestamps.

4. Fusion ERP Source Domains and Cash Semantics

ERP domain	Example source data	PCF use	Typical cash interpretation
Accounts Receivable	Invoices, due dates, receipts, customer/party, business unit	Operating cash inflows	Customer collections and expected cash receipts
Accounts Payable	Supplier invoices, due dates, payment schedule, supplier, BU	Operating cash outflows	Supplier payments and settlement timing
Cash Management	Bank balances, bank accounts, bank transactions/statements	Opening/closing cash position; actual cash	Available/booked balances and realized cash movement

Advanced source-readiness questions

- Are invoice due dates and payment terms operationally reliable?
- Are customer and supplier parties consistently mastered?
- Do bank accounts map unambiguously to legal entities and currencies?
- Are bank statements refreshed before the forecast SLA?
- Are business units and legal entities correctly assigned to users and transactions?
- Which transaction sources/types should be excluded because they do not represent due-date-based customer payment behavior?
- Is enough clean historical AR data available to support ML training when that method is used? Oracle guidance recommends at least 18 months of historical Receivables transactions for maximizing model training.

5. Application Enablement and Configuration

Oracle-inspired | Predictive Cash Forecasting

Application > Configure

Enable Features - Fusion ERP Integration

Enable Features

Map/Rename Dimensions

Integration Setup

Forecast Methods

Security

Jobs

Data Sources

☒ Accounts Receivable	Fusion Cloud Accounts Receivable	Enabled
☒ Accounts Payable	Fusion Cloud Accounts Payable	Enabled
☒ Bank Transactions	Fusion Cloud Cash Management	Enabled

Dimensions created / required

- Business Unit (mandatory)
- Party (mandatory)
- Entity / Legal Entity
- Bank / Bank Account
- Currency
- Cash Flow Line Item

Critical enablement note

Enable Data Sources during the first feature enablement when Fusion ERP integration is required. Required integration dimensions cannot be created later through incremental enablement.

Enable

Critical configuration rule

If Fusion ERP integration is part of the design, select Data Sources the first time features are enabled. This creates required integration dimensions and appropriate line items. Business Unit and Party are mandatory with Fusion ERP integration.

Suggested enablement sequence

1. Create a new Planning application of type Cash Forecasting.
2. Open Application > Configure > Enable Features.
3. Enable the forecast horizon/features required by the treasury operating model.
4. Under Data Sources, enable Accounts Receivable, Accounts Payable and Bank Transactions as required.
5. Map/rename dimensions and confirm Business Unit and Party are present.
6. Enable cash flow categories and forecasting methods appropriate to each line item.
7. Complete feature enablement, sign out and sign back in.
8. Validate that seeded forms, rules, line items, navigation flows and dimensions were created.

6. Integration Connectivity and Security Model

Cross-cloud access design

Layer	Configuration	Validation test
Identity / SSO	Single sign-on across Cloud ERP and Cloud EPM	Same user accesses both applications without separate context switching.
EPM -> ERP connection	Manage Enterprise Application / topology connection	Connection test succeeds and seeded sources are visible.
ERP job role	Appropriate predefined or user-defined roles and privileges	User can access required AR/AP/Cash analytical content.
ERP data access	Manage Data Access for Users	User sees only authorized BU/legal entity data.
EPM entity security	Match EPM entity scope with ERP access	Drill-through does not expose or fail on mismatched entities.
Integration account	Least-privilege service/user identity	Pipeline runs unattended and survives password/credential policy.

Security anti-patterns

- Giving EPM users broad ERP access merely to make drill-through work.
- Using different entity definitions in EPM and ERP without a governed crosswalk.
- Sharing one privileged integration account across environments without audit ownership.
- Testing only administrator access and assuming production users will behave identically.

7. End-to-End Process Flow

End-to-End Fusion ERP -> PCF Forecast Cycle

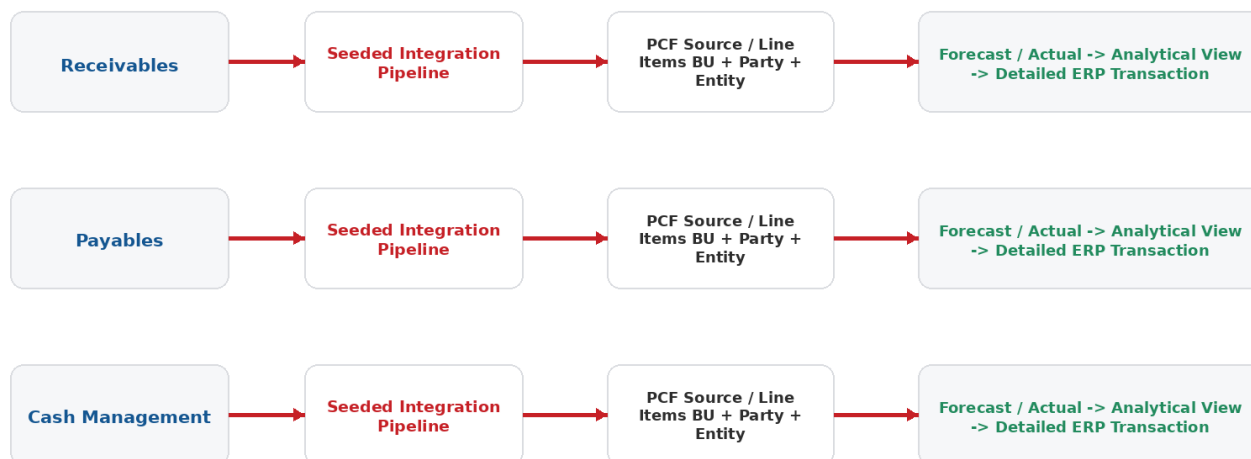

Operational checkpoints

Stage	Control	Evidence
ERP readiness	Source jobs/business processes current	Timestamp and source completeness report
Extract	Seeded pipeline succeeds	Job ID, row count, extraction timestamp
Mapping	0 critical unmapped members	Mapping validation/reject report
Load	Source amount reconciles to PCF staging/target	Control totals by BU/entity/currency
Forecast	Rules/methods complete	Calculation status and method audit
Analysis	Exceptions reviewed	Exception workbench and commentary
Drill-through	Representative records trace to ERP detail	Test evidence by AR/AP/Cash source
Approval	Forecast released	Workflow status / reviewer sign-off

8. Data Flow and Transaction Traceability

Data Flow and Transaction Traceability

Control principle: every loaded balance should be traceable to source, mapping, period, entity and user security context.

Traceability metadata to preserve

Attribute	Why it matters
Source system / source module	Separates AR, AP, Cash Management and external data.
Business Unit	Operational ownership and security.
Party	Customer/supplier behavior, segmentation and drill-through.
Legal Entity / Entity	Cash ownership and consolidation.
Bank / Bank Account	Opening balance and liquidity view.
Currency	Transaction, local and reporting-currency behavior.
Transaction / document reference	Reconciliation and exception resolution.
Extract/load timestamp	Freshness and SLA evidence.
Integration job ID	Restart/reprocessing audit trail.
Forecast method / version	Explains how ERP data became a forecast amount.

9. Source-to-Target Mapping Design

Source attribute	Example	Target / use	Control
Business Unit	US Operations	Business Unit: US_OPS	Reject unknown BU; no default-to-total mapping.
Customer Party	Customer A	Party: CUST_A	Maintain governed party mapping / hierarchy.
Supplier Party	Supplier X	Party: SUP_X	Separate supplier and customer semantics if needed.
Legal Entity	US Manufacturing LLC	Entity: US_MFG_01	Tie to security and reporting hierarchy.
Bank Account	US-USD-OPER-01	Bank Account: US_OPER_01	Validate entity + currency ownership.
Invoice Currency	USD	Currency: USD	No silent FX substitution.
AR due amount	1,250,000	Customer Collections	Map to operating inflow.
AP due amount	780,000	Supplier Payments	Map to operating outflow.
Available Balance	6,400,000	Opening Cash Balance	Use consistent available/booked policy.

Mapping governance

Mappings should be versioned, promoted through environments, peer-reviewed and reconciled. For production, define an owner for each hierarchy and a reject threshold that blocks forecast publication when critical members are unmapped.

10. Seeded Data Integration Pipelines

Recommended orchestration

Sequence	Pipeline / job	Dependency	Failure action
1	Cash Management / bank data	Bank statements or source balance refreshed	Stop opening-balance publication if stale beyond SLA.
2	Accounts Receivable	AR operational processing current	Reject / quarantine mapping failures; do not silently drop cash.
3	Accounts Payable	AP operational processing current	Reconcile due amounts and payment schedule.
4	Target validation	All source loads complete	Validate counts, totals, currency, BU/entity coverage.
5	Forecast calculation	Validated target data	Run methods/rules and capture status.
6	Variance & insight refresh	Forecast calculation complete	Refresh dashboards and exceptions.
7	Drill-through smoke test	Analytical Views / security available	Block release if traceability is materially broken.

Idempotent operations

Design reprocessing so the same source period can be safely rerun. A failed mapping correction should not duplicate previously loaded transactions or balances.

11. Advanced Lab Scenario - Company and Forecast Context

BISP Manufacturing Group uses Oracle Fusion Cloud Financials and Cloud EPM Predictive Cash Forecasting. Treasury runs a 13-week weekly forecast. The lab integrates AR, AP and Cash Management for entity US_MFG_01 and Business Unit US_OPS, then validates the result through drill-through.

Parameter	Lab value
Forecast cycle	Weekly rolling forecast - 13 weeks
Entity	US_MFG_01
Business Unit	US_OPS
Reporting currency	USD
Opening bank balance	\$6,400,000
Minimum cash buffer	\$3,000,000
AR open amount (near-term sample)	\$5,250,000
AP open amount (near-term sample)	\$3,180,000
Other forecasted operating outflows	\$1,120,000
Scenario	Base and Stress

Expected learning outcome

Students will load ERP-sourced cash drivers, reconcile integration control totals, run a forecast, detect a liquidity risk under stress, and trace a selected AR forecast value back to the source transaction context.

12. Lab Step 1 - Validate ERP Operational Readiness

1. Confirm AR invoices are complete, posted and carry valid due dates and payment terms.
2. Confirm AP invoices/payment schedules are current and approved for the lab data set.
3. Confirm Cash Management bank balance is refreshed for US_OPER_01.
4. Confirm Business Unit, legal entity, party and bank account attributes are populated.
5. Validate user access to US_OPS and US_MFG_01 in Fusion Cloud ERP.
6. Validate Analytical Views are available for AR/AP/Cash Management.
7. Capture the source control totals shown below.

Source	Records	Amount / balance	As-of
AR open invoices	42	\$5,250,000	W1 cut-off
AP open invoices	31	\$3,180,000	W1 cut-off
Bank balance	1	\$6,400,000	08:00 cut-off

Pass condition

Source totals are approved by the lab instructor before any EPM pipeline is executed.

13. Lab Step 2 - Configure and Run Integration

1. In PCF, confirm Fusion ERP Data Sources are enabled for AR, AP and Bank Transactions.
2. Open Data Integration and locate the seeded PCF integrations/pipelines for the three Fusion ERP source domains.
3. Set the lab period, scenario, entity/business-unit scope and required run-time parameters.
4. Run Cash Management first, followed by AR and AP.
5. Review process details, job IDs, extracted rows, loaded rows and rejected rows.
6. Resolve any rejected mapping members, rerun the affected source and revalidate totals.

Pipeline	Expected source total	Loaded total	Reject tolerance
Cash Management	\$6,400,000	\$6,400,000	0 critical
Accounts Receivable	\$5,250,000	\$5,250,000	0 critical
Accounts Payable	\$3,180,000	\$3,180,000	0 critical

14. Lab Step 3 - Build the Weekly Cash Forecast

For training purposes, the near-term weeks use ERP transaction timing, while later weeks can use driver/trend/statistical methods depending on the line item and available history. This hybrid approach demonstrates why PCF supports multiple methods by line item and period range.

Week	Opening	AR inflow	AP outflow	Other OCF	Net change	Closing
W1	6.40	1.25	(0.78)	(0.22)	0.25	6.65
W2	6.65	1.10	(0.72)	(0.18)	0.20	6.85
W3	6.85	0.90	(0.65)	(0.16)	0.09	6.94
W4	6.94	0.80	(0.58)	(0.20)	0.02	6.96
W5	6.96	0.65	(0.47)	(0.17)	0.01	6.97
W6	6.97	0.55	(0.42)	(0.19)	-0.06	6.91

Amounts in USD millions. Formula: Closing Cash = Opening Cash + AR Collections - AP Payments - Other Operating Cash Outflows.

Checkpoint

Week 1 closing cash = $6.40 + 1.25 - 0.78 - 0.22 = \6.65M . Week 2 opening cash must equal Week 1 closing cash.

15. Lab Step 4 - Stress Scenario and Liquidity Response

Stress the ERP-driven forecast by delaying 30% of W2 and W3 customer collections by two weeks, accelerating \$0.40M of supplier payments into W2, and reducing the available bank balance by \$0.50M for a restricted amount.

Stress driver	Base	Stress	Cash impact
Opening available balance	\$6.40M	\$5.90M	-\$0.50M
W2 AR collections	\$1.10M	\$0.77M	-\$0.33M
W3 AR collections	\$0.90M	\$0.63M	-\$0.27M
W2 AP payments	\$0.72M	\$1.12M	-\$0.40M
Minimum buffer	\$3.00M	\$3.00M	Control threshold

Treasury decision rules

Condition	Action
Closing cash $\geq$ buffer + \$1M	No funding action; monitor variance.
Closing cash between buffer and buffer + \$1M	Review discretionary payments and collection actions.
Closing cash < buffer	Open funding/working-capital action; escalate to Cash Manager.
Traceability unavailable for material variance	Do not approve forecast until source evidence is restored.

16. Lab Step 5 - Drill Through to Fusion ERP

1. From the PCF forecast/actual form or analysis view, select the W1 Customer Collections amount for US_MFG_01.
2. Use the drill-through option to open the related Fusion ERP aggregate Analytical View.
3. Validate aggregate amount, Business Unit, customer/party, currency and period context.
4. Navigate further to the detailed Receivables transactions.
5. Select one invoice and confirm document number, customer, due date, open amount and transaction status.
6. Return to PCF and document the transaction reference in the lab evidence sheet.

What good traceability looks like

A treasury user should be able to explain a material forecast amount without leaving an unexplained reconciliation gap between the PCF value, the aggregate ERP view and the underlying transaction population.

17. Reconciliation and Forecast Accuracy Framework

Control	Formula / test	Purpose
Source-to-load reconciliation	ERP source total - PCF loaded total = 0	Completeness
Opening balance reconciliation	ERP available/booked balance - PCF opening cash = 0	Cash-position integrity
Roll-forward	Prior closing - current opening = 0	Forecast continuity
Forecast variance	Actual cash - forecast cash	Accuracy diagnosis
Variance %	(Actual - Forecast) / Forecast	Comparable KPI
Forecast Value Add	Baseline error - method error	Tests whether method improves forecast
Drill-through sample	PCF value -> AV -> transaction list	Traceability

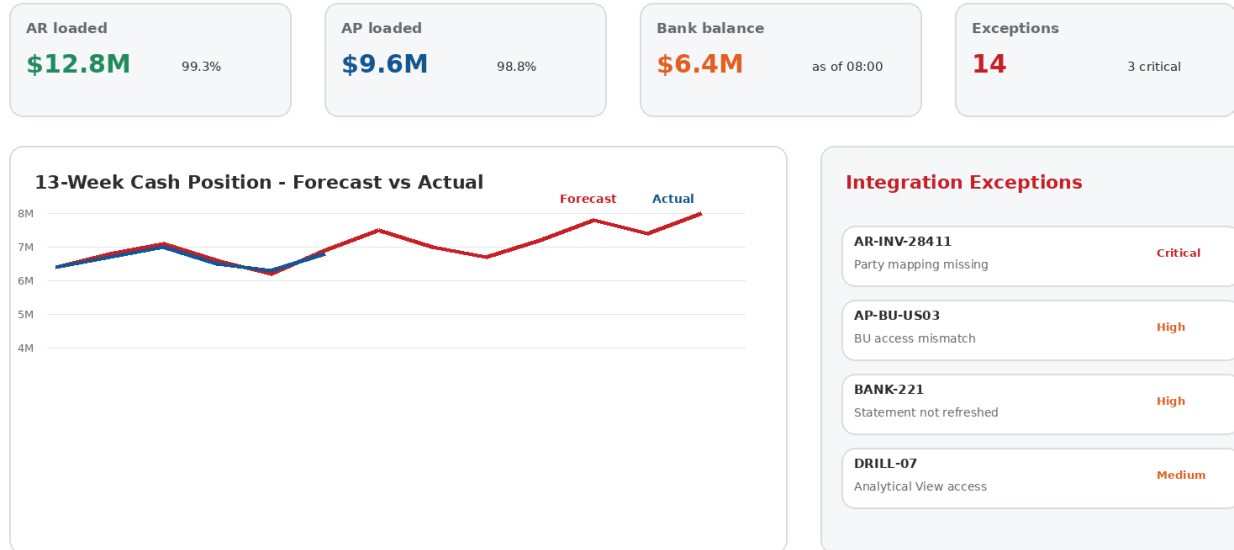

Variance root-cause tags

- Timing: payment/collection shifted but total exposure unchanged.
- Amount: invoice/payment amount changed.
- Source freshness: ERP data not refreshed by cut-off.
- Mapping: record landed in wrong BU/entity/party/line item.
- Method: trend/driver assumption no longer valid.
- Manual override: planner adjustment created variance.
- Security/reporting: data visible in one application but not the other.

18. Oracle-Inspired Integration Cockpit

Oracle-inspired | Fusion ERP Integration Monitor

Cash Forecast Integration Cockpit

Recommended KPI cards

- AR/AP records and amounts loaded vs expected.
- Latest bank balance timestamp and freshness SLA.
- Rejected/unmapped record count.
- Critical integration exceptions.
- Forecast vs actual variance by source and cash-flow line item.
- Drill-through success rate for sampled material balances.
- Next forecast run and last successful pipeline time.

19. Error Log and Diagnostic Examples

Sample Integration Log / Error Console

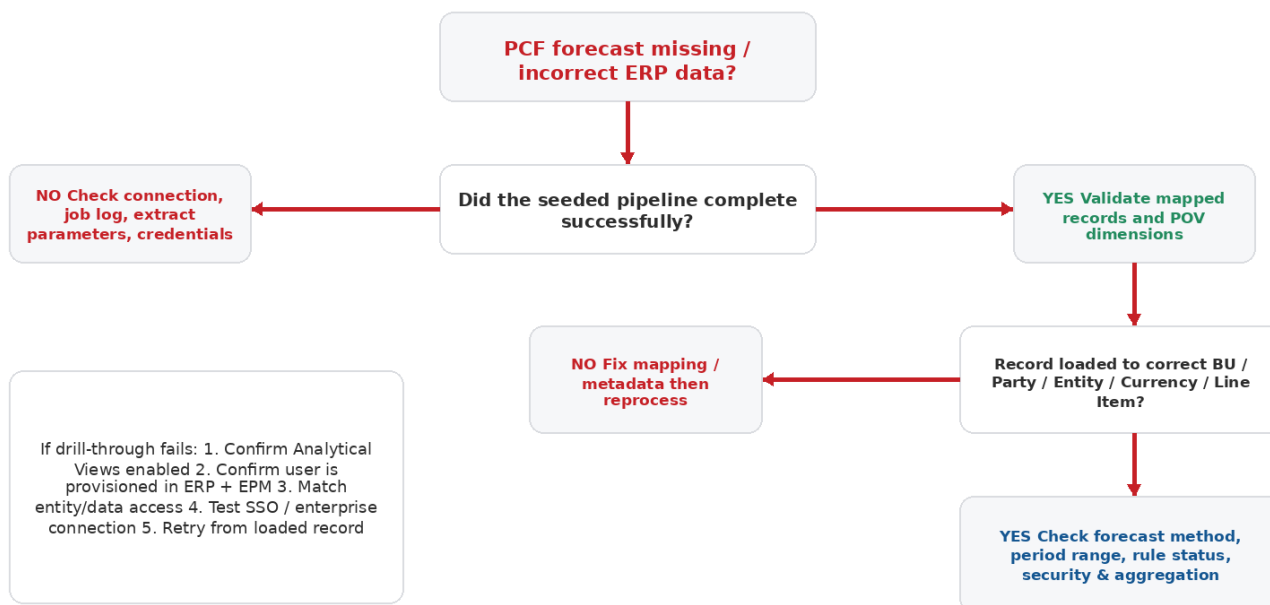

```
08:01:03 INFO PCF_AR_PIPELINE started | Period=FY26-W35 | BU=ALL
08:01:24 INFO Extracted 42,812 AR records from Fusion source
08:01:31 WARN 126 records excluded: transaction type not cash-due-date aligned
08:01:46 ERROR PARTY_11882 has no target Party mapping | Source=ACME-EU
08:01:48 ERROR BU_US03 access denied for integration user | security context mismatch
08:02:05 INFO AP pipeline loaded 18,410 records | reject=0
08:02:44 WARN Cash Management bank statement timestamp older than SLA: 7h 42m
08:03:10 ERROR Drill-through failed: Analytical View privilege not granted
08:03:22 INFO Job ended PARTIAL_SUCCESS | Loaded=61,096 | Rejected=128
```

Support classification

Severity	Meaning	Operational response
Critical	Forecast completeness/security/traceability materially compromised	Block publication; assign incident owner immediately.
High	Material source or mapping issue with workaround	Correct before approval or document approved workaround.
Medium	Non-material exception or isolated drill-through issue	Track to closure; forecast may proceed based on governance.
Info	Expected processing/audit message	Retain for run history.

20. Troubleshooting Decision Tree

Integration Troubleshooting Decision Tree

Symptom-to-fix reference

Symptom	Likely cause	Fix
Pipeline authentication fails	Expired/incorrect enterprise connection credential	Test connection, update credential/token policy, rerun.
AR amount short	Source exclusion, extract parameter or mapping reject	Compare source count, exclusions and reject log.
AP lands in wrong entity	BU/legal-entity crosswalk issue	Correct mapping; purge/reprocess affected scope.
Bank opening balance stale	Cash Management source not refreshed	Refresh source/statement and enforce cut-off SLA.
Party member rejected	Missing Party mapping/member	Create governed member/mapping and reprocess.
Drill-through blank	Analytical View/security/SSO mismatch	Validate AV enablement and user access in both clouds.
Forecast amount unexpected	Wrong method/period range or stale assumption	Review method configuration and recalculate.
Duplicate amount after rerun	Non-idempotent load or uncleared target slice	Use controlled replace/reprocess strategy.

21. Automation, Scheduling and Production Runbook

Run phase	Example schedule	Owner	Control
ERP operational cut-off	06:00	ERP Operations	AR/AP/Cash processes current
Bank/Cash refresh	06:30	Treasury Ops	Bank timestamp within SLA
PCF source pipelines	07:00	EPM Integration	All sources complete; rejects reviewed
Validation/reconciliation	07:30	Cash Analyst	Control totals pass
Forecast calculation	07:45	EPM	Rules/methods successful
Exception review	08:00	Cash Manager	Critical exceptions cleared
Drill-through sample	08:15	Controller / Support	Representative traceability passes
Publish / approve	08:30	Treasury Manager	Workflow approved

Restart strategy

- Rerun only the failed source/scope when possible.
- Use job IDs and source timestamps to prove which data version is active.
- Do not publish partial-success data without explicit governance.
- After mapping fixes, revalidate both record counts and amounts.
- After security fixes, retest with a non-admin production-like user.
- Retain a last-known-good forecast snapshot for operational continuity.

22. Implementation Checklist

Area	Go-live requirement
Architecture	Separate EPM PCF instance and Fusion ERP source domains confirmed.
Subscription	EPM Enterprise eligibility confirmed.
Analytical Views	Required views enabled and tested.
Data Sources	AR/AP/Bank Transactions enabled at initial PCF feature enablement.
Dimensions	Business Unit and Party plus Entity/Bank/Currency mappings designed.
Connections	EPM-to-ERP enterprise connection tested.
Security	ERP roles/data access and EPM entity security aligned.
Operational readiness	AR/AP/Cash data complete and current before forecast cut-off.
Pipelines	Seeded pipelines parameterized, scheduled and restart-tested.
Reconciliation	Counts/amounts/timestamps and opening cash controls documented.
Forecast methods	Method by line item and horizon approved.
Traceability	Drill-through tested for AR, AP and Cash Management samples.
Monitoring	Critical/high/medium thresholds and alert ownership defined.
Runbook	Daily/weekly/monthly operating procedure approved.
UAT	Business scenarios, security and failure-recovery cases signed off.

23. Advanced Student Challenge

Complete the following extension without changing the core seeded integration pattern. Document all assumptions and controls.

1. Add an external Treasury Management System source for a financing cash-flow line item while retaining Fusion ERP AR/AP/Cash as seeded sources.
2. Design a mapping that prevents a bank account from loading to the wrong legal entity.
3. Create a forecast method matrix where Weeks 1-4 use transaction-based ERP data and Weeks 5-13 use a driver or trend method.
4. Define a control that blocks approval when the bank balance is older than four hours.
5. Create three exception cases: missing Party, BU security mismatch and stale bank statement. Show the expected job status and remediation.
6. Demonstrate an audit trail from a PCF forecast value to an ERP Analytical View and transaction detail, then explain how the evidence would be retained for support.

Assessment rubric

Area	Weight	Evidence expected
Integration design	25%	Correct source/target semantics and job sequence
Controls	25%	Reconciliation, freshness, security and exception thresholds
Forecast design	20%	Appropriate method by horizon/line item
Traceability	20%	End-to-end drill-through evidence
Operations	10%	Runbook, restart and incident handling

24. Technical Reference and Oracle Source Notes

The following Oracle documentation was used as the current capability baseline for this lab guide. Product behavior can evolve by monthly update, so implementation teams should recheck release notes before production design or upgrade validation.
