Oracle EPM Predictive Cash Forecasting

Oracle-inspired UI | White enterprise background | Red accent elements | Dark charcoal headings

1. Introduction and Learning Objectives

This advanced lab guide explains how to use Predictive Planning inside the Oracle EPM Predictive Cash Forecasting ecosystem. Predictive Planning helps users predict future performance from historical data, compare the resulting values with existing plans or forecasts, and then copy accepted predictions into a forecast scenario for further use. The guide is written for advanced students, treasury users, implementation teams, and support analysts.

- Understand where Predictive Planning fits into cash forecasting design.
- Learn the required prerequisites for valid historical prediction.
- Run predictions and interpret accuracy, outliers, and explainability.
- Compare predictive results with manual, driver, trend, or baseline forecasts.
- Copy accepted predictions into a working forecast scenario professionally.
- Troubleshoot common design, data, and operational issues.

Core concept

Predictive Planning is a history-based forecasting capability. Oracle documentation describes it as a way to predict future performance from historical data, compare and validate plans and forecasts using those predictions, and copy prediction values into a forecast scenario when the results are suitable for business use.

2. Product Design View

In a Predictive Cash Forecasting implementation, Predictive Planning should be treated as a governed forecasting service rather than a one-click black box. It works best when planners know which line items are history-rich, which require strong explainability, and which should remain under manual or driver-based control.

- Use Predictive Planning for recurring cash items that have usable historical series.
- Keep business-event-driven items such as one-off tax or financing events under manual control.
- Review explainability before adopting predictions into management reporting.
- Provide clear ownership between planner, reviewer, and approver.
- Retain forecast comparisons so predictive results can be challenged constructively.

Predictive Planning Functional Architecture

Oracle EPM Predictive Cash Forecasting

Figure 1. Functional architecture for Predictive Planning in Oracle EPM PCF.

3. Functional Architecture and Data Flow

A complete Predictive Planning solution includes historical source data, valid forms or ad hoc grids, prediction options, Oracle time-series model selection, explainability review, copy-to-forecast capability, and dashboards for final comparison.

Predictive Planning Data Flow Diagram

inputs, processing, and outputs

Figure 2. Data flow from historical series to prediction output and management review.

Component	Purpose	Primary Owner
Historical Data	Provide the time series used for prediction	Administrator / Business Data Owner
Valid Form or Ad Hoc Grid	The launch point for prediction	Planner / Administrator
Prediction Options	Control run horizon and analysis settings	Planner
Prediction Engine	Generate best-fit forecast output	Oracle EPM Service
Explainability Review	Assess confidence and business suitability	Planner / Cash Manager
Copy to Forecast Scenario	Move accepted values into planning flow	Planner
Dashboards and Comparison	Challenge and approve predictive output	Management / Treasury

4. Method Selection and Decision Logic

Predictive Planning is powerful, but it is not the only forecasting method. Teams should deliberately decide when to use it and when to prefer driver-based, trend-based, statistical, or manual methods. A decision framework helps keep the implementation both practical and credible.

Predictive Planning Decision Tree

when should you use predictive planning?

Figure 3. Decision tree for deciding when Predictive Planning should be used.

SmartArt: Predictive Planning Building Blocks

Oracle EPM Predictive Cash Forecasting

Figure 4. SmartArt-style view of Predictive Planning building blocks.

- Use Predictive Planning when history is strong and periodic behavior is meaningful.

- Use manual methods for exceptional cash items with no historical basis.
- Use comparison dashboards to challenge predictive results against other methods.
- Use business override only after documenting the reason and impact.

5. End-to-End Process Flow

Predictive Planning follows a lifecycle from form selection to forecast adoption. In an advanced implementation, each step should be repeatable, auditable, and easy to teach to treasury users.

Predictive Planning Process Flow

from historical data to approved forecast

Role	Responsibilities
Planner	Runs predictions, reviews charts, and compares forecast quality.
Cash Manager	Approves the use of predictive values and signs off key forecast decisions.
Administrator	Designs forms, secures access, and helps with troubleshooting.
Reviewer / Finance Lead	Challenges assumptions, interprets variance, and validates business reasonableness.

6. Configuration Mockup and Dashboard Mockup

The next visual artifacts provide Oracle-inspired mockups for design discussions and training. They help advanced students connect the concepts of valid form setup, prediction options, explainability review, and dashboard-based adoption into a single operational picture.

Copy to Forecast
Submit Review

Design Notes

- Predictive Planning runs on valid forms and ad hoc grids.
- Historical data should support the requested horizon.
- Review accuracy and explainability before copying

7. Data Model, Governance, and Prerequisites

Minimum prerequisites

Requirement	Description	Why it matters
Valid Form or Grid	Prediction must be launched from a valid form or ad hoc grid.	Without a valid layout, prediction cannot run correctly.
Historical Data	Sufficient historical periods must exist for the requested forecast horizon.	Prediction quality depends on history depth.
POV Integrity	Correct scenario, entity, account, and time selections are essential.	Wrong POV leads to misleading prediction results.
Writable Target Scenario	Needed when copying prediction values into forecast.	Prevents copy errors and governance issues.
Review Process	Someone must interpret accuracy and explainability.	Avoids blind acceptance of model output.

Governance practices

- Establish which line items are prediction-enabled and which are excluded.
- Document a minimum history requirement for each time horizon.
- Require reviewer comments before copying predictions into an official scenario.
- Separate working forecast scenarios from approved management scenarios.
- Preserve comparison history so users can show why predictive values were accepted or rejected.

8. Worked Example – Weekly Customer Collections Prediction

This worked example shows how a treasury planner might use Predictive Planning to estimate customer collections for the next 13 weeks. The purpose is to demonstrate both the technical process and the business interpretation expected from an advanced student or implementation consultant.

Input Parameter	Value
Line Item	Customer Collections
Entity	US_North
Historical Range	Jan-2024 to Jun-2026
Prediction Horizon	13 weeks
Existing Baseline Method	Driver-based collections model
Target Scenario	Forecast_Review
Review Requirement	Cash Manager approval

Step 1 – Run prediction

- Open the valid PCF form for Customer Collections.
- Confirm the POV and date range.
- Run Predictive Planning for a 13-week horizon.
- Review the generated chart and best-fit method.

Step 2 – Review explainability and accuracy

Suppose the generated prediction shows a MAPE of 6.8%, visible quarter-end seasonality, and three adjusted outliers. The planner observes that the pattern is broadly consistent with the business and decides the result is credible enough to compare with the baseline driver model.

Step 3 – Compare results

Week	Baseline Collections	Predicted Collections	Variance	Observation
1	14.0M	14.2M	+0.2M	Very close to baseline
2	14.5M	14.7M	+0.2M	No concern
3	15.0M	15.4M	+0.4M	Seasonal uplift
4	15.1M	15.7M	+0.6M	Prediction slightly stronger
5	15.5M	16.0M	+0.5M	Within accepted threshold
6	15.7M	16.1M	+0.4M	Stable trend
7	16.0M	16.4M	+0.4M	Continued gradual rise
8	16.2M	16.8M	+0.6M	Pattern remains credible
9	16.6M	17.0M	+0.4M	Near quarter-end uplift
10	16.9M	17.4M	+0.5M	High but explainable
11	17.1M	17.8M	+0.7M	Requires reviewer comment
12	17.4M	18.0M	+0.6M	Still acceptable
13	17.8M	18.3M	+0.5M	Prediction adopted

Step 4 – Adopt into forecast

Because the predictive output is explainable and close to the baseline, the planner copies the predicted values into the Forecast_Review scenario. A reviewer adds a note explaining that the prediction was accepted because the historical pattern is stable and the forecast differs from the baseline only within a tolerable range.

9. Training Material – Step-by-Step Lab Instructions

Exercise 1: Prerequisite validation

- Identify a cash line item with adequate historical depth.
- Open a valid form or ad hoc grid and confirm the data is visible.
- Check the intended prediction horizon against available history.
- Confirm the target scenario is writable.

Exercise 2: Run the prediction

- Launch Predictive Planning from the Actions menu.

- Set the historical and forecast ranges.
- Accept or review the prediction options.
- Run the process and wait for the result panel.

Exercise 3: Analyze the output

- Review prediction chart details.
- Note the best-fit method and any outlier adjustment.
- Record available accuracy measures.
- Compare predicted values to the line item's current forecast.

Exercise 4: Copy and compare

- Copy the accepted predicted values to a working forecast scenario.
- Open a comparison dashboard to measure the difference from baseline.
- Document whether the prediction should be accepted, adjusted, or rejected.
- Present the outcome to the reviewer or cash manager.

10. Technical Reference

Important operating notes

- Predictive Planning works on valid forms and ad hoc grids.
- It uses time-series forecasting techniques and automatically selects a best-fit method for the data available.
- Prediction quality improves when the historical data window is sufficient and clean.
- Advanced users should review explainability and not copy values blindly.
- Accepted predictions can be copied into a forecast scenario for formal planning use.

Recommended processing sequence

Step	Action	Why it matters
1	Validate form and history	Confirms the data is prediction-ready.
2	Set range and options	Ensures the right horizon and control settings.
3	Run prediction	Generates future values from historical data.
4	Review explainability	Tests whether the result is credible.
5	Compare to baseline	Supports business decision-making.
6	Copy to target scenario	Moves accepted values into forecast workflow.
7	Record comments	Creates auditability and training trace.

11. Troubleshooting and Log Examples

Predictive Planning issues are usually caused by invalid form design, insufficient historical data, incorrect POV selection, or governance restrictions on target scenarios. Support teams should combine log review with business context review.

Log / Error Examples

common predictive planning support cases

Predictive Planning Execution Log

[INFO] Valid form detected for line item CUSTOMER_COLLECTIONS.

[INFO] Historical range: Jan-2024 through Jun-2026.

[WARN] Requested prediction horizon exceeds recommended range for available history.

[INFO] Outlier detection enabled and 3 outliers adjusted.

[INFO] Best-fit method selected automatically by Predictive Planning.

[ERROR] Copy to forecast failed: target scenario is read-only.

[ERROR] Prediction not available for selected member: insufficient historical periods.

[INFO] User reviewed explainability chart and reran with revised date range.

[SUCCESS] Prediction copied to Forecast_Review scenario.

Troubleshooting Tips

- Ensure the target scenario is writable.
- Use enough historical periods for the requested forecast window.
- Re-check POV and valid form design before rerunning.

Figure 9. Example execution log and troubleshooting panel.

Issue	Likely Cause	Resolution
Prediction unavailable	Insufficient historical periods or invalid form	Increase history or redesign the form.
Copy to forecast failed	Target scenario is read-only	Use a writable working scenario.
Prediction looks unrealistic	Outliers, special events, or poor series quality	Review explainability and shorten/clean the range.
User distrusts output	No comparison or explanation provided	Show accuracy, seasonality, and baseline comparison.
Wrong line item predicted	POV selection error	Re-check entity, account, and scenario context.

12. Implementation Guide

Suggested delivery phases

- Phase 1 – Design: identify candidate line items and define governance.
- Phase 2 – Build: prepare valid forms, dashboards, and writable scenarios.
- Phase 3 – Test: validate prediction quality across multiple line items.

- Phase 4 – Train: run guided labs for planners and reviewers.
- Phase 5 – Deploy: move the process into production with controls.
- Phase 6 – Support: monitor prediction behavior and refine design rules.

Implementation checklist

- ☐ Candidate line items approved
- ☐ Minimum historical data rule defined
- ☐ Valid forms or ad hoc layouts tested
- ☐ Writable forecast scenario available
- ☐ Comparison dashboard configured
- ☐ Review and approval process documented
- ☐ Support runbook prepared
- ☐ Advanced user training completed
- ☐ Pilot predictions signed off

13. Conclusion

Predictive Planning is a high-value capability for Oracle EPM Predictive Cash Forecasting because it gives planners an evidence-based way to forecast future cash behavior from historical patterns. When supported by explainability, comparison, and governance, it strengthens decision quality and reduces dependence on manual estimation alone.

This BISP lab guide is structured so it can serve multiple purposes at once: a design reference for consultants, an implementation guide for project teams, a training workbook for advanced learners, a technical reference for planners and administrators, and a troubleshooting aid for ongoing support.
